ConocoPhillips - Climate Change 2022

C0. Introduction

C0.1

(C0.1) Give a general description and introduction to your organization.

ConocoPhillips is an independent exploration and production (E&P) company headquartered in Houston, Texas. We explore for, produce, transport and market crude oil, bitumen, natural gas, natural gas liquids and liquefied natural gas on a worldwide basis. As of Dec. 31, 2021, we had operations and activities in 14 countries.

We manage our operations through six operating segments defined by geographic area: Lower 48; Asia Pacific; Europe, Middle East and North Africa; Alaska; Canada; and Other International and Exploration. ConocoPhillips’ operating segments include a strong base of legacy production, multiple ongoing development programs that offer low cost of supply as well as low carbon emission intensity, and focused exploration opportunities.

The company embraces its role in responsibly accessing, developing and producing oil and natural gas to help meet the world's energy needs, both today and throughout the energy transition. ConocoPhillips has the technical capability to operate globally while maintaining a relentless focus on safety and environmental stewardship.

C0.2

(C0.2) State the start and end date of the year for which you are reporting data.

C1.2a

(C1.2a) Describe where in the organizational structure this/these position(s) and/or committees lie, what their associated responsibilities are, and how climate-related issues are monitored (do not include the names of individuals).

The Executive Leadership Team (ELT) has final responsibility for developing corporate strategy, implementing sustainability efforts, and reporting company performance. The Executive Vice President (EVP), Strategy, Sustainability and Technology, an executive officer with overall accountability for corporate planning and development, including corporate strategy and long-range planning, serves as the ELT’s climate change champion. The Sustainability and Public Policy Executive Council (SPEC), a sub-committee of the ELT, has global oversight of existing and emerging sustainable development (SD) and public policy risks and trends including SD and climate-related governance, strategy, risk management and reporting.

The SPEC meets regularly to review and discuss priority topics such as climate change, water, biodiversity, human rights and stakeholder engagement. The council’s scope includes:
- Review risk trends and set priorities.
- Review and approve public policy and sustainability policies, positions, strategies, goals and actions on priority matters.
- Prioritize resource allocation to external engagement and initiatives.
- Recommend which issues warrant additional executive leadership, full ELT review or additional board engagement.
- Review and endorse agenda and meeting content for the Public Policy and Sustainability Committee (PPSC) of the board.

The SPEC is also the governance link to the PPSC whose oversight covers SD matters including climate-related risks.

C1.3

(C1.3) Do you provide incentives for the management of climate-related issues, including the attainment of targets?

<table>
<thead>

C2. Risks and opportunities

C2.1

(C2.1) Does your organization have a process for identifying, assessing, and responding to climate-related risks and opportunities?
Yes

C2.1a

(C2.1a) How does your organization define short-, medium- and long-term time horizons?

<table>
<thead>
<tr>
<th>Frame</th>
<th>From (years)</th>
<th>To (years)</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short-term</td>
<td>1</td>
<td>5</td>
<td>Our near-term time horizon is one to five years, during which we can complete short-cycle drilling campaigns and small projects. Our GHG forecasting and financial planning processes are used to determine risks and opportunities that could have a material financial impact for that period. Our near-term climate-related risks are generally government policy-related and managed at the business unit level through policy advocacy and technology to reduce emissions.</td>
</tr>
<tr>
<td>Medium-term</td>
<td>6</td>
<td>10</td>
<td>Our medium-term time horizon is six to 10 years, during which we can complete most major projects and revise our portfolio significantly if required. Our GHG forecasting and financial planning processes are used to determine the risks and opportunities that could have a material financial impact for that period. Medium-term risks take longer to impact our business and may include emerging policy that is not yet fully defined. These risks are managed by business unit planning but, if significant, may also be managed by corporate strategies and company-wide risk assessments.</td>
</tr>
<tr>
<td>Long-term</td>
<td>11</td>
<td>25</td>
<td>Our long-term time horizon is 11 years and beyond. Generally, long-term risks are managed by our scenario analysis and Climate Risk Strategy, as they include long-term government policy, technology trends and consumer preferences that affect supply and demand. They may also include risks that align with long-term physical climate scenarios.</td>
</tr>
</tbody>
</table>

C2.1b

(C2.1b) How does your organization define substantive financial or strategic impact on your business?

Our SD Risk Management Standard mandates a process for operated assets and projects to assess and manage risks to ensure corporate oversight, assurance and consistent implementation. Risks are identified and assessed against the physical, social and political settings of our operations by subject matter experts in each business unit (BU) and project. Local concerns may influence the potential importance of these environmental and social matters, including cumulative effects.

Each risk is then assessed using a matrix that evaluates both its likelihood and consequence. In evaluating the consequence severity, we consider potential impacts on employee and public safety, sociocultural and economic impacts to stakeholders, environmental impacts, and reputational and financial implications. Risks identified as significant or high at the corporate or BU level are included in the corporate SD Risk Register. The company undertakes a review of SD risks annually and updates the SD Risk Register and associated action plans. An audit protocol for the standard was developed in 2020 and we implemented a regular audit schedule in 2021.

The SD Risk Management Standard ensures that an action plan is developed to track mitigation activities for each risk included in the corporate SD Risk Register. These plans include details about our commitments, related responsibilities and milestones. As part of annual updates to the register, the action plans and their effectiveness are evaluated, and decisions are made to continue mitigation measures, add new measures or simply monitor the risk for further developments. Significant and high risks are removed from the corporate risk register when mitigation actions have reduced the level of risk, and they are tracked to ensure ongoing mitigation effectiveness. The SD Risk Register and action plans are also used to track performance and guide goal setting.

Action plans for prioritized risks are typically managed at the BU level, along with the ongoing management of SD performance and engagement designed to minimize or avoid other social and environmental aspects of our business. Overarching risk management actions, such as greenhouse gas (GHG) target setting, prioritization of global emissions-abatement projects and disclosure and reporting, are managed at the corporate level. Line-of-sight goals for business units and key functions are shown as specific action items within the action plans. Mitigation actions can range from single or multiyear specific projects to routine and long-term programs.

Sustainability risks are integrated into the corporate Enterprise Risk Management (ERM) system. Risks from the corporate SD Risk Register are mapped to relevant enterprise risks including market, reputational, operational and political. Owners of these enterprise risks, who are ELT members or senior managers, are briefed on the risks and our mitigation activities. Enterprise risks are then presented to the Audit and Finance Committee (AFC) of the Board. The AFC receives annual updates on how enterprise risk is being addressed, mitigated and managed across the company. Material enterprise risks are reviewed by the AFC for disclosure in the company’s Annual Report.
(C2.2) Describe your process(es) for identifying, assessing and responding to climate-related risks and opportunities.

**Value chain stage(s) covered**
- Direct operations

**Risk management process**
- Integrated into multi-disciplinary company-wide risk management process

**Frequency of assessment**
- Annually

**Time horizon(s) covered**
- Short-term
- Medium-term
- Long-term

**Description of process**

We utilize an integrated management system approach to identify, assess, characterize and manage climate-related risks. This system links directly to the enterprise risk management (ERM) process, which includes an annual risk review by executive leadership and the Board of Directors.

To understand long-term risk and mitigation options, we utilize four scenarios. This scenario approach helps us evaluate distinct outcomes related to the potential timing and intensity of government climate change policy development, the pace of alternative energy technology development and trends in consumer behaviour. This information is then used to shape our analysis and consideration of various outcomes for policy, technology and market risk.

We periodically review emerging climate-related risks with our Executive Leadership Team as part of our scenario monitoring system. A cross-functional team enters events into a centralized database that is reviewed regularly for indications that risks are changing or developing. We use this “early warning” system to inform our strategies in a timely manner so that we can identify and implement effective mitigation measures. The scenario monitoring system helps us understand the pace and direction of the energy transition. For example, if regulations and technology were moving more quickly than in our scenarios, this would indicate that we might be moving to a 1.5-degree scenario similar to the range identified in the IPCC “1.5 degree” report, and we would take action accordingly. In our resiliency workshops, we use externally produced scenarios that describe the range of possible future physical risk.

As part of the annual risk management process mandated by our SD Risk Management Standard, we examine operated assets and major projects against the physical, social and political settings of our operations. Subject matter experts in each business unit (BU) and project identify and describe climate-related risks.

Each risk is then assessed using a matrix that evaluates both its likelihood and consequence. Risks rated significant or high are included in the corporate SD Risk Register.

In evaluating the consequence level, we consider potential impacts on employee and public safety, sociocultural and economic impacts to stakeholders, environmental impact, and reputational and financial implications.

As part of the process, we examine the interdependence of risks and work to identify emerging risks such as new regulatory requirements and emerging greenhouse gas (GHG) pricing regimes.

**Value chain stage(s) covered**
- Direct operations

**Risk management process**
- A specific climate-related risk management process

**Frequency of assessment**
- Not defined

**Time horizon(s) covered**
- Short-term
- Medium-term
- Long-term

**Description of process**

A climate-related risk assessment is conducted on any future project development that costs more than $50 million net and is expected to emit more than 25,000 metric tons CO₂ equivalent (CO₂(e)) net to ConocoPhillips during any year of its lifespan. This assessment is mandatory for investment approval. Project teams for qualifying projects are required to assess the potential risks and opportunities associated with GHG emissions, GHG regulation and a physically changing climate based on local jurisdictions and geographies as opposed to using our corporate scenarios. The climate risk assessment guideline provides a framework for project teams to:

- Forecast GHG emissions for the life of the project.
- Evaluate climate-related risks and opportunities, including physical and transition risks that apply to the project.
- Make decisions on GHG emissions control in project design, including energy efficiency solutions, power source selection, emissions management, carbon capture and storage/utilization, and external compliance options such as the purchase or origination of GHG offsets.
- Evaluate the potential cost of GHG emissions in project economics.

We assess climate-related risks early in the project engineering stage to better inform our investment decisions and facility design. The ConocoPhillips Health, Safety and Environment (HSE) Due Diligence Standard also provides further guidance on accounting for sustainable development issues for new acquisitions, new business ventures, joint ventures and real property transactions.

Please explain:
- Current regulation: Current regulation and how it might evolve is considered in our risk assessments through the SD Risk Assessment Standard, Climate Risk Assessment, and our scenario analysis. For example, we consider the impact of current cap and trade programs where we operate, such as the EU ETS, and how the carbon pricing may change. In our scenarios, we consider different magnitudes and speeds of implementation for government actions to view a range of possible futures.
- Emerging regulation: Emerging regulation is considered in our risk assessments through the SD Risk Assessment Standard, Climate Risk Assessment, and our scenario analysis. For example, we consider the impact of possible future carbon taxes in our projects with a $60/tonne carbon tax sensitivity as more fully described in our response to C11.3a. In our scenarios, we consider different magnitudes and speeds of implementation for government actions to view a range of possible futures.
- Technology: Technology is considered in our risk assessments through the SD Risk Assessment Standard, Climate Risk Assessment, Marginal Abatement Cost Curve, and our scenario analysis. For example, we assess technology solutions in our Marginal Abatement Cost Curve, which calculates a "break even cost of carbon" for each emission reduction project that is evaluated by the Executive Leadership Team. This has included technologies such as Flow Control Devices that are currently being implemented in Canada. In our scenarios, we consider different magnitudes and speeds of implementation for technological advancement to view a range of possible futures.

Legal
- Relevant: Legal risk is considered in our risk assessments through the SD Risk Assessment Standard and Climate Risk Assessment.

Market
- Relevant: Market risk is considered in our risk assessments through our scenario analysis. Our scenarios illustrate a range of demand and supply implications.

Reputation
- Relevant: Reputation is considered in our risk assessments through the SD Risk Assessment Standard and Climate Risk Assessment. For example, we consider that reputation could affect community support and the ability to attract a talented workforce. Reputational impacts are managed through our Stakeholder Engagement Action Plan and investor engagement strategy.

Acute physical
- Relevant: Acute physical risk is considered in our risk assessments through the SD Risk Assessment Standard and Climate Risk Assessment. For example, we consider the impact of increased severe weather events to our projects and operations in our SD risk assessments, which are required by all operating business units and projects.

Chronic physical
- Relevant: Chronic physical risk is considered in our risk assessments through the SD Risk Assessment Standard and Climate Risk Assessment. For example, we consider the impact of changes in sea levels to our projects and operations in our SD risk assessments, which are required by all operating business units and projects. Another example is related to installing infrastructure on Alaska's North Slope. The ground consists of permafrost that extends 500 to 2,000 feet below the surface. Permafrost is a mix of soil, water and/or rock that remains frozen for at least two consecutive years with the exception of the top level, referred to as the "active layer," which thaws to a depth of 1 to 3 feet each summer. As the climate warms, we maintain resilience to the dynamics of degrading permafrost and changes to the active layer by using various engineering tools. One important mitigation tool is the use of passive thermosyphons to stabilize areas of thaw adjacent to infrastructure. Commonly known as "heat pipes," passive thermosyphons are simple devices, usually vertical sealed pipes that are partially embedded in the permafrost. [https://www.conocophillips.com/sustainability/sustainability-news/story/using-thermosyphons-on-alaska-s-north-slope/](https://www.conocophillips.com/sustainability/sustainability-news/story/using-thermosyphons-on-alaska-s-north-slope/)

(C2.3) Have you identified any inherent climate-related risks with the potential to have a substantive financial or strategic impact on your business?

Yes

(C2.3a) Provide details of risks identified with the potential to have a substantive financial or strategic impact on your business.

**Primary potential financial impact**
- Increased direct costs

**Climate risk type mapped to traditional financial services industry risk classification**
- Not Applicable

**Company-specific description**
- Product efficiency regulations and standards - Bitumen from Oil Sands assets represented approximately 4% of 2021 net production. The Alberta Technology Innovation and Emissions Reduction (TIER) regulation requires any existing facility with emissions equal to or greater than 100,000 metric tonnes of carbon dioxide, or equivalent, per year to meet a facility benchmark intensity. The cost of compliance and investment in emissions intensity reductions will continue to influence decisions in our Canada business unit.

**Time horizon**
- Short-term

**Likelihood**
- Virtually certain

**Magnitude of impact**
- Low

**Are you able to provide a potential financial impact figure?**
- Yes, a single figure estimate

**Potential financial impact figure (currency)**
- 1250000
The Alberta Technology Innovation and Emissions Reduction (TIER) regulation requires any existing facility with emissions equal to or greater than 100,000 metric tones of carbon dioxide, or equivalent, per year to meet a facility benchmark intensity. The total cost of these regulations in 2021 was approximately $1 million (net share before-tax). The estimated financial impact represents a 25% increase in current costs. Because there are numerous factors that could impact our assessments, the estimates are inherently imprecise.

Cost of response to risk

Description of response and explanation of cost calculation
Reducing the GHG emissions intensity of our in situ oil sands operations continues to be a priority for our Canada operations. We are using technology to co-inject non-condensable gas (NCG) with steam to reduce steam requirements and increase production at Surmont. This allows for a reduction in the steam-to-oil ratio (SOR) and consequent reduction in GHG emissions intensity. The technology can be applied to almost any steam-assisted gravity drainage (SAGD) operation, resulting in GHG intensity reductions of approximately 15-35%. Early project results have been shared with Canada’s Oil Sands Innovation Alliance (COSIA) Innovation Plus consortia to encourage widespread deployment of the technology throughout Canada’s oil sands. In response to lower oil prices from the COVID-19 pandemic, in 2020 and 2021, the BU developed a new co-injection alternative, “NCG Lite,” to allow for the continued injection of NCG during curtailment without the need for additional infrastructure installation.

We are also piloting multilateral well technology including innovative drilling and completion methods and thermal junction technology in existing vertical wellbores to increase production from a single surface location. Thermal junction technology enables the drilling of multiple lateral sections without the need for additional above-ground infrastructure. These wells reduce surface footprint and provide increased bitumen production without additional steam injection, thereby reducing GHG emissions intensity and operating costs per barrel of bitumen.

Both technology projects have benefitted from financial support provided through Emissions Reduction Alberta (ERA). ERA invests the proceeds from carbon pricing paid by large industrial emitters into Alberta’s Technology Innovation and Emissions Reduction (TIER) regulation to reduce GHGs and strengthen the competitiveness of new and incumbent industries in Alberta. These investments help innovators develop and demonstrate GHG-reducing technologies that lower costs, improve competitiveness, and accelerate Alberta’s transformation to a low-carbon economy.

Comment
Cost of management is integrated into our cost structure.

Please note: We included risks in this section which were most straightforward to quantify. Other risks that may become material include: general environmental regulations, international agreements, technology, changes in temperature extremes, and reputation.
Because there are numerous factors that could impact our assessments, the estimates are inherently imprecise.

Cost of response to risk

Description of response and explanation of cost calculation

In our Norway business unit, we set specific actions to study emission reduction opportunities. Furthermore, we run economics with full CO2 tax and quota cost. For projects in jurisdictions without carbon taxes, or taxes less than $60/tonne, we run a $60/tonne sensitivity to evaluate the economics of a possible carbon tax. This is more fully described in our response to C11.3a.

Comment

Cost of management is integrated into our cost structure.

Please note: We included risks in this section which were most straightforward to quantify. Other risks that may become material include: general environmental regulations, international agreements, technology, changes in temperature extremes, and reputation.

Yes, a single figure estimate

Potential financial impact figure (currency)

27500000

Potential financial impact figure – minimum (currency)

<Not Applicable>

Potential financial impact figure – maximum (currency)

<Not Applicable>

Explanation of financial impact figure

2021 cost of compliance for the EU ETS and UK ETS was approximately US$22 million net share before tax. Financial implications depend on timing, amount, and amount of pass-through to consumer. The estimated financial impact represents a 25% increase in current costs. Because there are numerous factors that could impact our assessments, the estimates are inherently imprecise.

Cost of response to risk

Description of response and explanation of cost calculation

Comment

Cost of management is integrated into our cost structure.

Please note: We included risks in this section which were most straightforward to quantify. Other risks that may become material include: general environmental regulations, international agreements, technology, changes in temperature extremes, and reputation.

C2.4

(C2.4) Have you identified any climate-related opportunities with the potential to have a substantive financial or strategic impact on your business?

Yes

C2.4a

(C2.4a) Provide details of opportunities identified with the potential to have a substantive financial or strategic impact on your business.
Where in the value chain does the opportunity occur?
Direct operations

Opportunity type
Resource efficiency

Primary climate-related opportunity driver
Use of more efficient production and distribution processes

Primary potential financial impact
Reduced indirect (operating) costs

Company-specific description
Product efficiency regulations and standards - Research and development opportunities may lead to lower carbon intensity products. Bitumen from Oil Sands assets represents 4% of ConocoPhillips’ net 2021 production. The Alberta Technology Innovation and Emissions Reduction (TIER) regulation requires any existing facility with emissions equal to or greater than 100,000 metric tonnes of CO2e per year to meet an industry benchmark intensity.

Time horizon
Short-term

Likelihood
Virtually certain

Magnitude of impact
Low

Are you able to provide a potential financial impact figure?
Yes, a single figure estimate

Potential financial impact figure (currency)
250000

Potential financial impact figure – minimum (currency)
<Not Applicable>

Potential financial impact figure – maximum (currency)
<Not Applicable>

Explanation of financial impact figure
2021 cost of compliance for TIER was approximately US$1 million. The estimated financial impact represents a 25% decrease in current costs due to emission reduction measures.

Cost to realize opportunity

Strategy to realize opportunity and explanation of cost calculation
Reducing the GHG emissions intensity of our in situ oil sands operations continues to be a priority for our Canada operations. We are using technology to co-inject non-condensable gas (NCG) with steam to reduce steam requirements and increase production at Surmont. This allows for a reduction in the steam-to-oil ratio (SOR) and consequent reduction in GHG emissions intensity. The technology can be applied to almost any steam-assisted gravity drainage (SAGD) operation, resulting in GHG intensity reductions of approximately 15-35%. Early project results have been shared with Canada’s Oil Sands Innovation Alliance (COSIA) Innovation Plus consortia to encourage widespread deployment of the technology throughout Canada’s oil sands. In response to lower oil prices from the COVID-19 pandemic, in 2020 and 2021, the BU developed a new co-injection alternative, “NCG Lite,” to allow for the continued injection of NCG during curtailment without the need for additional infrastructure installation.

We are also piloting multilateral well technology including innovative drilling and completion methods and thermal junction technology in existing vertical wellbores to increase production from a single surface location. Thermal junction technology enables the drilling of multiple lateral sections without the need for additional above-ground infrastructure. These wells reduce surface footprint and provide increased bitumen production without additional steam injection, thereby reducing GHG emissions intensity and operating costs per barrel of bitumen.

Both technology projects have benefitted from financial support provided through Emissions Reduction Alberta (ERA). ERA invests the proceeds from carbon pricing paid by large industrial emitters into Alberta’s Technology Innovation and Emissions Reduction (TIER) regulation to reduce GHGs and strengthen the competitiveness of new and incumbent industries in Alberta. These investments help innovators develop and demonstrate GHG-reducing technologies that lower costs, improve competitiveness, and accelerate Alberta’s transformation to a low-carbon economy.

Comment
Cost of management is integrated into our cost structure.

Please note: We included opportunities in this section which were most straightforward to quantify. Other opportunities that may become material include: changes in precipitation extremes and droughts (incentives for water recycling); reputation.

Where in the value chain does the opportunity occur?
Direct operations

Opportunity type
Resource efficiency

Primary climate-related opportunity driver
Use of more efficient production and distribution processes

Primary potential financial impact
Reduced indirect (operating) costs

Company-specific description
Carbon taxes in certain jurisdictions including Norway may incentivize energy efficiency projects. In 2021, Norway production made up 9% of net company production.

Time horizon
Short-term

Likelihood
Virtually certain

Magnitude of impact
Medium-low

Are you able to provide a potential financial impact figure?
Yes, a single figure estimate

Potential financial impact figure (currency)
8750000

Potential financial impact figure – minimum (currency)
<Not Applicable>

Potential financial impact figure – maximum (currency)
<Not Applicable>

Explanation of financial impact figure
2021 cost of compliance US$35 million net share before tax in Norway. The estimated financial impact represents a 25% decrease in current costs due to emission reduction measures.

Cost to realize opportunity

Strategy to realize opportunity and explanation of cost calculation
Norway’s carbon tax system and high-tax regime for oil and gas operations helps improve the economics of investing in electrification solutions. The Norway BU is investigating multiple options to achieve partial electrification in our Ekofisk operations, including:

- Small-scale local offshore wind development (preliminary concept with two 10-14 MW turbines) to replace gas-powered turbines at Ekofisk, achieving about 60,000 tonnes of CO2 emission reductions per year.
- Connection to a possible future offshore wind power hub with subsea power cables connected to shore.

We also evaluate other opportunities using the Marginal Abatement Cost Curve, which calculates a “breakeven cost of carbon” for each emission reduction project that is evaluated by the Executive Leadership Team.

Comment
Cost of management is integrated into our cost structure.

Please note: We included opportunities in this section which were most straightforward to quantify. Other opportunities that may become material include: changes in precipitation extremes and droughts (incentives for water recycling); reputation.

Magnitude of impact
Low

Are you able to provide a potential financial impact figure?
Yes, a single figure estimate

Potential financial impact figure (currency)
4750000

Potential financial impact figure – minimum (currency)
<Not Applicable>

Potential financial impact figure – maximum (currency)
<Not Applicable>
Explanation of financial impact figure
2021 cost of compliance in the EU ETS was US$19 million net share before tax. The estimated financial impact represents a 25% decrease in current costs due to emission reduction measures.

Cost to realize opportunity

Strategy to realize opportunity and explanation of cost calculation
Since 2005, ConocoPhillips facilities across Europe have participated in the European Union’s emissions-trading program (ETS). Our Commercial organization trades allowances on the secondary market exchanges. We also evaluate opportunities using the Marginal Abatement Cost Curve, which calculates a “breakeven cost of carbon” for each emission reduction project that is evaluated by the Executive Leadership Team.

Comment
Cost of management is integrated into our cost structure.

Please note: We included opportunities in this section which were most straightforward to quantify. Other opportunities that may become material include: changes in precipitation extremes and droughts (incentives for water recycling); reputation.

C3. Business Strategy

C3.1

(C3.1) Does your organization’s strategy include a transition plan that aligns with a 1.5°C world?

Row 1

Transition plan
No, but our strategy has been influenced by climate-related risks and opportunities, and we are developing a transition plan within two years

Publicly available transition plan
<Not Applicable>

Mechanism by which feedback is collected from shareholders on your transition plan
<Not Applicable>

Description of feedback mechanism
<Not Applicable>

Frequency of feedback collection
<Not Applicable>

Attach any relevant documents which detail your transition plan (optional)
<Not Applicable>

Explain why your organization does not have a transition plan that aligns with a 1.5°C world and any plans to develop one in the future
Our Plan for the Net-Zero Energy Transition is built upon ConocoPhillips’ “Triple Mandate”: meet energy transition pathway demand, deliver competitive returns and achieve our net-zero emissions ambitions.

1. Build a resilient asset portfolio: Focus on low cost of supply and low greenhouse gas intensity (GHG) resources that meet transition pathway energy demand.
2. Commit to near-, medium- and long-term targets: Reducing operational (Scope 1 and 2) emissions over which we have ownership and control, with an ambition to become a net-zero company for Scope 1 and 2 emissions by 2050.
3. Address end-use emissions: Advocate for a well-designed, economy-wide price on carbon that would help shift consumer demand from high-carbon to low-carbon energy sources.
4. Pursue transition opportunities: Evaluate potential investments in emerging energy transition and low-carbon technologies.
5. Track the energy transition: Utilize a comprehensive scenario planning process to calibrate and understand alternative energy transition pathways and test the resilience of our corporate strategy to climate risk.
6. Maintain capital discipline: Use scenario analysis and a fully burdened cost of supply, including cost of carbon, as the primary basis for capital allocation.

Scenario Planning at ConocoPhillips:
We use scenarios in our strategic planning process to:

1. Gain better understanding of external factors that impact our business to assist in the identification of major risks and opportunities and inform mitigating actions.
2. Identify leading indicators and trends.
3. Test the robustness of our strategy across different business environments.
5. Inform how we position our business, as technologies and markets evolve, to capitalize on opportunities that meet risk and return criteria.

We use four main energy transition scenarios in our global energy model: Current Trends, Moderate Transition, Accelerated Transition and Paris Agreement in our global energy model. The four scenarios incorporate a wide range of possible outcomes for energy and carbon emissions. Technology development (both complementary and competing), government policy (focused on both the supply and demand side) and social choices play leading roles in influencing the outcomes in each case. Regional differences were included to reflect areas of the world that may take a different pace or direction.

Explain why climate-related risks and opportunities have not influenced your strategy

</tbody>
</table>
**Climate-related scenario** | **Scenario analysis coverage** | **Temperature alignment of scenario** | **Parameters, assumptions, analytical choices**
--- | --- | --- | ---
Transition scenarios | Company-wide | Unknown | Paris Agreement Scenario
  This scenario assumes technology breakthroughs, major social movements to reduce fossil fuel consumption and rapid global policy coordination to price GHG emissions at a level that materially reduces fossil fuel use and emissions. It also assumes that OECD countries and China implement a pricing mechanism by 2050 rising from $50/TeCO2e in 2030 to $120 by 2050. Other non-OECD nations follow by imposing prices of $10/TeCO2e in 2030 rising to $60 by 2050. The scenarios assume significant technological advances which reduce battery, wind and solar generation costs, improve fuel efficiencies for internal combustion engines (80% more fuel efficient by 2050), improve energy efficiency in buildings and lighting, and other impacts to energy production, delivery and consumption. Technology and efficiencies allow total energy demand in 2050 to be 25% below 2019's level with 50% of energy provided by non-fossil fuels.

The global oil market peaks in 2023, before significantly declining thereafter. Energy storage improvements lead to EVs achieving parity with internal combustion engine vehicles by the mid-2020s, thus incentivizing climate-conscious consumers to purchase EVs. Consequently, 70% of the passenger automobile fleet is electric in 2050, and transportation sector demand falls to 25% of total oil demand. Oil supply dynamics evolve as most production occurs in OPEC countries and Russia and geopolitics play an even larger role in oil prices and the supply and price of oil.

The natural gas market peaks in 2024. Natural gas generates only 9% of global electricity in 2050, while wind and solar grow to produce 60% of electricity in 2050. Global gas demand shifts to emerging markets in Asia, the Middle East, CIS and Africa. Only 26% of global gas demand remains in North America and Europe. The market also becomes more reliant on OPEC and Russia for supply as North American gas output declines by over 58%.

In this scenario, countries and companies push for accelerated progress along net-zero pathways and implement supportive policies along with capital funding to progress new technologies. Hydrogen remains a front-runner, with blue (using CCS) and green hydrogen supporting increased petrochemical and industrial activities. In the later part of the scenario, electrolysis costs fall sharply, and green hydrogen accelerates along with other new technologies, pushing out blue and grey (Steam Methane Reforming) hydrogen production.

---

(C3.2b) Provide details of the focal questions your organization seeks to address by using climate-related scenario analysis, and summarize the results with respect to these questions.

**Row 1**

**Focal questions**

What are the main factors that drive future development and that should be considered as part of the Company's strategic decision making process?

**Results of the climate-related scenario analysis with respect to the focal questions**

The scenarios we have developed describe possible pathways leading to a particular outcome. Scenarios are hypothetical constructs and are not meant to be used as predictions of what is likely or forecasts of what we think is going to happen; they should be used to illustrate what factors drive future developments. We use scenarios in our strategic planning process to:

- Gain better understanding of external factors that impact our business to assist in the identification of major risks and opportunities and inform mitigating actions.
- Identify leading indicators and trends.
- Test the robustness of our strategy across different business environments.
- Communicate risks appropriately.

Using scenarios enables us to understand a range of risks around potential commodity market prices associated with various GHG reduction scenarios. To assist our capital allocation decisions, we can test our current portfolio of assets and investment opportunities against these future possibilities and identify where strengths and weaknesses may exist.

We rarely make any decision based on a single source of information, but use a range of analyses, inputs and information when developing our strategy. The detail of our scenarios gives insight into the analysis we use to inform our strategic decision making and reinforces to stakeholders and shareholders that we are both preparing for reductions in GHGs consistent with the Paris Climate Agreement and developing resilient strategies that reflect the complex and uncertain range of energy futures.

We use four main energy transition scenarios in our global energy model: Current Trends, Moderate Transition, Accelerated Transition and Paris Agreement in our global energy model. The four scenarios incorporate a wide range of possible outcomes for energy and carbon emissions. Technology development (both complementary and competing), government policy (focused on both the supply and demand side) and social choices play leading roles in influencing the outcomes in each case. Regional differences were included to reflect insights of the areas that may take a different pace or direction. While these scenarios extend to 2050, well beyond our operational planning period, they give insights on trends that could have an implication for near- and medium-term decisions and enable choices on the creation or preservation of future options.

Each scenario models the full energy system including oil, natural gas, solar, wind and nuclear, as well as their related GHG emissions and pricing policies. In 2021, near-term adjustments were made to account for actuals, and the modeled energy system has been expanded to include hydrogen and carbon capture, as both technologies appear vital to the energy system.

### C3.4 Describe where and how climate-related risks and opportunities have influenced your strategy.

<table>
<thead>
<tr>
<th>Have climate-related risks and opportunities influenced your strategy in this area?</th>
<th>Description of influence</th>
</tr>
</thead>
<tbody>
<tr>
<td>Products and services</td>
<td>Compliance with policy changes that create a GHG tax, fee, emissions trading scheme or GHG reductions could significantly increase product costs for consumers and reduce demand for natural gas- and oil-derived products. Demand could also be eroded by conservation plans and efforts undertaken in response to global climate-related risk, including plans developed in connection with the Paris Agreement. Many governments also provide, or may in the future provide, tax advantages and other subsidies to support the use and development of alternative energy technologies that could impact demand for our products. However, there are also opportunities associated with increased demand for lower-carbon energy sources such as natural gas to displace coal in power generation and in combination with carbon capture and storage in the production of hydrogen for industrial use. Our scenario analysis indicates that as the energy sector transitions, it will be important to be competitive on both cost of supply and GHG emission intensity. We have adjusted our portfolio to concentrate on lower-cost production and have divested some of our higher-emissions-intensity natural gas and oil sands fields. We have also set near-term goals by 2025 to reduce methane intensity by 10% and a zero routine flaring ambition; medium-term targets by 2030 to reduce GHG intensity 40%-50%; and, long-term ambition to be net-zero by 2050.</td>
</tr>
<tr>
<td>Operations</td>
<td>We use a marginal abatement cost curve (MACC) process to collect potential GHG emissions reduction projects from our business units, prioritize them based on their cost and reduction volume, and implement the most cost-effective projects. Each year, the executive leadership team determines which projects to fund based on a number of criteria including capital efficiency (i.e. the lowest $/TeCO2 equivalent), scalability, and repeatability among a few others. We fund projects that have a break-even cost of up to $60/Te CO2e, as well as projects that anticipate forthcoming regulatory changes. We have allocated $200 million in the 2022 capital budget to energy transition activities, a majority of which will address Scope 1 and 2 emissions reduction projects across our global operations selected through this program.</td>
</tr>
<tr>
<td>Supply chain and/or value chain</td>
<td>We have acted to mitigate our GHG emissions for many years. Our first Climate Change Action Plan was introduced in 2008 and since then we have voluntarily reduced our annual global GHG emissions compared to business as usual. In 2017, we introduced a long-term GHG emissions intensity target to incentivize reductions in our production operations as well as project design, exploration and portfolio decisions. To date this has resulted in a reduction of both our emissions intensity and our absolute emissions. Most of the reduction projects carried out since 2008 have paid for themselves through increased sales of natural gas. Around two-thirds of the projects carried out relate to the reduced emissions of methane from reduced venting, updated plunger lifts or replacing pneumatic controllers. To continue those reductions, we have set up regional teams in North America, Australia, Southeast Asia and Europe to use the MACC process to identify energy efficiency projects for consideration in the Long-Range Plan. By evaluating our day-to-day decisions regarding flaring, drilling, completions and equipment use we have gained a sharper focus on energy consumption, along with increased revenue, reduced energy costs, reduced emissions and an improved overall cost of supply. In 2020, we announced a climate risk strategy that sets an ambition to reduce our operational greenhouse gas (GHG) emissions to net-zero by 2050. We also substantially revised our 2030 target to reduce our GHG emissions intensity, endorsed the World Bank Zero Routine Flaring by 2030 initiative and set a target to reduce methane emissions intensity. These targets inform internal climate goals at the business level and support innovation on efficiency and emissions reduction, GHG regulatory risk mitigation and climate-related risk management throughout the life cycle of our assets. We are one of more than 80 companies participating in The Environmental Partnership, a coalition of natural gas and oil companies focused on accelerating environmental performance improvements from operations across the USA. The partnership prioritises managing methane emissions and aligns with our focus on emissions reductions and high environmental standards.</td>
</tr>
<tr>
<td>Investment in R&amp;D</td>
<td>Technology will play a major role in addressing GHG emissions, whether through reducing fugitive emissions or lowering the energy intensity of our operations or value chain. In Canada we are sponsoring an APRIZE to support development of innovative ways to reuse carbon associated with steam generation in the oil sands. (Link: <a href="https://www.conocophillips.com/sustainability/sustainability-news/story/carbon-xprize-transforming-the-future/">https://www.conocophillips.com/sustainability/sustainability-news/story/carbon-xprize-transforming-the-future/</a> ) We are using carbon capture and storage technologies (CCS) to minimize the impact of our operations. We believe that CCS is a short-term solution to mitigate any CO2 emissions with more efficient and cost-effective technologies that avoid CO2 emissions entirely. We also have a focus on reducing our methane emissions from our upstream operations. Methane is a strong greenhouse gas and we have set ambitious targets to reduce methane emissions by 2025 and 2030. To meet these targets, we have set up regional teams in North America, Australia, Southeast Asia and Europe to use the MACC process to identify energy efficiency projects for consideration in the Long-Range Plan. By evaluating our day-to-day decisions regarding flaring, drilling, completions and equipment use we have gained a sharper focus on energy consumption, along with increased revenue, reduced energy costs, reduced emissions and an improved overall cost of supply. In 2020, we announced a climate risk strategy that sets an ambition to reduce our operational greenhouse gas (GHG) emissions to net-zero by 2050. We also substantially revised our 2030 target to reduce our GHG emissions intensity, endorsed the World Bank Zero Routine Flaring by 2030 initiative and set a target to reduce methane emissions intensity. These targets inform internal climate goals at the business level and support innovation on efficiency and emissions reduction, GHG regulatory risk mitigation and climate-related risk management throughout the life cycle of our assets. We are one of more than 80 companies participating in The Environmental Partnership, a coalition of natural gas and oil companies focused on accelerating environmental performance improvements from operations across the USA. The partnership prioritises managing methane emissions and aligns with our focus on emissions reductions and high environmental standards. The target will support innovation on efficiency and emissions reduction, GHG regulatory risk mitigation and climate-related risk management throughout the lifecycles of our assets. The target informs climate goals at the business level.

Our performance will be based on gross operated GHG emissions, stated in carbon dioxide-equivalent terms, divided by our gross operated production, stated in barrels of oil equivalent. The target is set in relation to our scope 1 emissions and scope 2 gross operated emissions as these are the emissions over which we have the most control. The target covers all GHGs, but in practice will likely apply to carbon dioxide and methane emissions as our emissions of other greenhouse gases are a small fraction of the total. For comparability purposes we exclude exploration and transportation services (i.e. Polar Tankers and Global Aviation) which are not directly related to oil or gas production, from our emissions totals. This may give rise to small differences between the intensity we report for our GHG target purposes and the intensity we report in our annual Sustainability Report.

Our current metrics also do not include the use of carbon offsets. We report our progress against the target on an annual, calendar-year basis. We intend to review and adjust our performance target at least every five years.

Science-Based Targets require us to include Scope 3 emissions. For E&P companies, the emissions from use of sold products is not in the scope of our control and leads to...
significant double-counting.

Is this target part of an emissions target?
Yes. Ambition to become a net-zero company for operational (scope 1 and 2) emissions by 2050.

Is this target part of an overarching initiative?
Please select

Please explain target coverage and identify any exclusions
Our long-term ambition to reduce our operational greenhouse gas (GHG) emissions to net-zero by 2050 reflects how we see the company’s role in the global challenge to address climate change, meet energy demand and remain financially competitive. Ultimately, the aims of the Paris Agreement will only be met as part of a global collaborative effort based on country, sector, company and consumer actions. The Paris Agreement is set in the context of sustainable development broadly and based on Nationally Determined Contributions (NDCs) which are designed for each country’s circumstances, resources and capabilities and reflect varying economies, geographies, and energy supply and demand dynamics.

As country NDCs evolve, we will continue to constructively advocate for effective climate policy including Paris-aligned carbon pricing. As policy and regulations evolve, we will also continue to carry out emissions reduction projects and lower the GHG intensity of our global operations on a technical and economic basis.

The ambition covers scope 1 and scope 2 gross operated emissions as these are the emissions over which we have the most control. Our scope 1 and scope 2 GHG emissions and emissions intensity calculations directly measure our climate performance and help us understand climate transition risk. For example, our ability to manage GHG emissions can help us measure resilience to emerging carbon tax regulation.

Please explain target coverage and identify any exclusions
Reducing methane emissions, even the small equipment leaks known as fugitive emissions, is a key part of our operations. Leak detection and repair (LDAR) is a work practice used to identify and repair leaking components, including valves, compressors, pumps, tanks and connectors, in order to reduce GHG emissions and increase efficiency. We fix leaks as soon as feasible, with many leaks repaired either the same day or within a few days of being detected. We have been voluntarily conducting pilots of new technologies at numerous facilities to determine effectiveness and scalability of next-generation detection technologies. This has included a wide range of tested technologies from ground-based to aerial, with each providing different strengths for different monitoring applications. The main objective with these technology pilots is to expeditiously identify, investigate and repair leaks associated with malfunctions and abnormal operating conditions, resulting in faster emissions mitigation. We continue to work with technology providers to develop and test technologies and we expect the technology will continue to improve over time.

The target covers scope 1 gross operated emissions.

Plan for achieving target, and progress made to the end of the reporting year
Our methane emissions reductions come from voluntary reduction activities and from portfolio changes. Similar to overall greenhouse gas emissions in 2021, absolute methane emissions increased due to the acquisition of additional Permian assets, however our methane intensity declined to 2.6kg CO2e/BOE or 13% from our 2019 baseline, exceeding our current target of 10% reduction by 2025.

List the actions which contributed most to achieving this target

Base year
2021
Flaring is a regulated and permitted process for the controlled release and burning of natural gas during oil and gas exploration, production and processing operations. Flaring is required to safely dispose of flammable gas released during process upsets or other unplanned events and to safely relieve pressure before performing equipment maintenance. Flaring is also used to control and reduce emissions of volatile organic compounds from oil and condensate storage tanks, and to manage emissions at well sites that lack sufficient pipeline infrastructure to capture gas for sale.

**Plan for achieving target, and progress made to the end of the reporting year**

Setting a target to get to zero routine flaring by 2030, with an ambition to get there by 2025, is a key near-term action within our ambition to become a net-zero company by 2050. While our flaring emissions make up only about 9% of our total GHG emissions, the target will drive continued near-term focus on routine flaring reductions across our assets. Routine flaring is defined as flaring of associated gas that occurs during the normal production of oil in the absence of sufficient facilities to utilize the gas onsite, dispatch it to a market or re-inject it. Flaring for safety reasons, non-routine flaring or flaring gas other than associated gas is not included as part of the World Bank Zero Routine Flaring initiative.

In 2021, the total volume of flared gas was 20.5 BCF, an increase of 41% from 2020. The increase was a result of increased flaring in the Permian due to the acquisition of Concho Resources. It was also a result of availability of more accurate data for estimating the volume of gas that is used as assist gas in our Eagle Ford asset.

While absolute flaring volumes increased, our flaring intensity continues to decline, decreasing 4% in 2021. Routine flaring volumes were collected for the first time in 2021. Routine flaring represents only 5% of our total volume of gas flared.

**List the actions which contributed most to achieving this target**

### C4.5a
(C4.5a) Provide details of your products and/or services that you classify as low-carbon products.

Level of aggregation
Product or service

Taxonomy used to classify product(s) or service(s) as low-carbon
Other, please specify (Reduction vs. coal in power generation)

Type of product(s) or service(s)
Please select

Description of product(s) or service(s)
Low-Carbon Emitting Products: In 2021, we supplied Asian markets with approximately 0.5 trillion cubic feet (or 1.5 billion cubic feet per day) of natural gas and LNG. To put this in perspective, if all the natural gas and LNG we sold to Asia in 2021 had been used to replace coal for electricity generation, GHG emissions would have been reduced by approximately 38 million metric tonnes, more than double the company’s combined Scope 1 and Scope 2 emissions for the year, based on EPA GHG emissions factors.

Have you estimated the avoided emissions of this low-carbon product(s) or service(s)

Description of product(s) or service(s)
LNG Process Technology: ConocoPhillips licenses the Optimized Cascade® Process technology for liquid natural gas (LNG) production and pioneered its use with aero derivative gas turbines. Together, the process and turbine technology achieve a 20% reduction in CO2 emissions compared with competing LNG technologies. ConocoPhillips currently operates a 4.5MTPA (million tons per annum) LNG facility near Gladstone, Australia. The ConocoPhillips Optimized Cascade® Process is licensed and used in plants located throughout the world.

Revenue generated from low-carbon product(s) or service(s) as % of total revenue in the reporting year
We design infrastructure and operate in a manner that protects air quality and reduces emissions. During drilling and hydraulic fracturing, we use closed-loop or reduced emissions completion techniques, which capture natural gas at the wellhead. Portable equipment and central gathering and distribution systems separate and collect the gas (mostly methane), solids (mainly proppant sand), and crude oil. This process enables us to significantly decrease venting and flaring. Whenever technically and practically feasible, we use central gathering systems to direct natural gas to sales pipelines.

Reducing methane emissions, even the small equipment leaks known as fugitive emissions, is a key part of our operations. Leak detection and repair (LDAR) is a work practice used to identify and repair leaking components, including valves, compressors, pumps, tanks and connectors, in order to reduce GHG emissions and increase efficiency. We fix leaks as soon as feasible, with many leaks repaired either the same day or within a few days of being detected. We have been voluntarily conducting pilots of new technologies at numerous facilities to determine effectiveness and scalability of next-generation detection technologies. This has included a wide range of tested technologies from ground-based to aerial, with each providing different strengths for different monitoring applications. The main objective with these technology pilots is to expeditiously identify, investigate and repair leaks associated with malfunctions and abnormal operating conditions, resulting in faster emissions mitigation. We continue to work with technology providers to develop and test technologies and we expect the technology will continue to improve over time.

**Yes**
ConocoPhillips utilizes a variety of leak detection and repair (LDAR) tools throughout our operations to identify and repair methane leaks. First, we conduct LDAR surveys as required by NSPS Subpart OOOQa and other state regulatory frameworks. Second, we utilize various innovative technologies that go above and beyond those required by regulations. These technologies are deployed at selected assets with the intent of evaluating and understanding their limitations and advantages. In addition, ConocoPhillips participates in a variety of voluntary LDAR programs offered through industry organizations, trade associations and joint partnerships.

Informal Inspections
ConocoPhillips personnel visit sites as part of their routine duties or in response to any operational issues at the sites. They identify any anomalous operating conditions that may contribute to audio, visual or olfactory (AVO) indications of potential leaks.

Audio Visual Olfactory (AVO) Inspections
We conduct formal AVO inspections to identify potential leaks at sites where regulatorily required, typically on a weekly basis. On most other sites where not regulatorily required, we perform these inspections periodically on a voluntary basis.

Instrument-based Method 21 Inspections
Where required by regulatory programs, we conduct LDAR inspections pursuant to requirements of U.S. EPA Reference Method 21, using an organic vapor analyzer.

Optical Gas Imaging (OGI) Camera Inspections
We perform periodic inspections at sites using OGI cameras where required by NSPS OOOQa regulations. In addition, at sites not subject to NSPS OOOQa regulations, we conduct periodic OGI inspections on a voluntary basis. In addition to the above LDAR methods either required by or based on regulatory requirements, ConocoPhillips continues to pilot and utilize innovative methods of monitoring, including some airborne and ground-based systems.

Airborne Systems
We have piloted several aerial technologies that enable routine monitoring over a larger area and allow for inspection of multiple facilities at a time. Airborne systems are an established way of screening of emissions from an entire facility, a group of facilities or a wider geographic area.

Drone-mounted technology has proven effective in detecting and locating the source of leaks due to their low-altitude capabilities; we currently use these on an ad-hoc basis. We have also utilized airplanes with mounted sensors to fly over facilities to detect leaks. If leaks are suspected, operations personnel take action to verify and repair the leak. The airplane sensors can detect smaller leaks, but our experience indicates that their effectiveness at pinpointing exact locations can be diminished in areas where other facilities are in close proximity, like the Permian Basin. ConocoPhillips has worked with Scientific Aviation to fly fixed-wing aircraft carrying detection gear over our Permian assets. We have also contracted with LeakScout to periodically fly helicopters equipped with OGI cameras around select sites. This program has also proven effective in identifying leaks.

While many of these airborne technologies are good at detecting leaks, they do require personnel following up with hand-held OGI cameras to identify the exact location of the leaks and the equipment involved, after which we conduct repairs and ensure mitigation was successful.

Satellite-based detection technology is another large-scale leak detection option. Although its effectiveness is improving rapidly, it has limitations in areas where facilities are located within close proximity to one another, such as in the Permian. An additional drawback has been the inability to identify small to medium leaks. Recently launched satellites are showing promise in providing better imaging and allowing more frequent monitoring of specific facilities. Although ConocoPhillips has used satellite detection in the Permian, we plan to pause its use until the technology shows further improvement. Additionally, the company has implemented monitoring systems to monitor for leaks on a continuous basis, as described below:

Continuous Monitoring Systems: Scientific Aviation (Metal Oxide-based SOOFIE Sensors)
ConocoPhillips has worked with Scientific Aviation to develop and test continuous methane monitoring devices at select Lower 48 facilities to further enhance LDAR capabilities. The SOOFIE (Systematic Observations of Facility Intermittent Emissions) sensor is a relatively simple method that incorporates cost-effective metal oxide sensors. Three to six sensors are affixed to poles strategically placed around locations to maximize effectiveness during varying wind conditions. Any elevated methane concentrations picked up by the SOOFIE sensors are integrated into an automated machine learning system that considers details such as equipment location, distance, wind speed and direction to identify the most probable emissions source.

C-OG4.8

(C-OG4.8) If flaring is relevant to your oil and gas production activities, describe your organization’s efforts to reduce flaring, including any flaring reduction targets.

Flaring is a regulated and permitted process for the controlled release and burning of natural gas during oil and gas exploration, production and processing operations. Flaring is required to safely dispose of flammable gas released during process upsets or other unplanned events and to safely relieve pressure before performing equipment maintenance. Flaring is also used to control and reduce emissions of volatile organic compounds from oil and condensate storage tanks, and to manage emissions at well sites that lack sufficient pipeline infrastructure to capture gas for sale.

Setting a target to get to zero routine flaring by 2030, with an ambition to get there by 2025, is a key near-term action within our ambition to become a net-zero company by 2050. While our flaring emissions make up only about 9% of our total GHG emissions, the target will drive continued near-term focus on routine flaring reductions across our assets. Routine flaring is defined as flaring of associated gas that occurs during the normal production of oil in the absence of sufficient facilities to utilize the gas onsite, dispatch it to a market or re-inject it. Flaring for safety reasons and non-routine flaring is excluded as part of the World Bank Zero Routine Flaring initiative.

In 2021, the total volume of flared gas was 20.5 BCF, an increase of 41% from 2020. The increase was a result of increased flaring in the Permian due to the acquisition of Concho Resources. It was also a result of availability of more accurate data for estimating the volume of gas that is used as assist gas in our Eagle Ford asset.

While absolute flaring volumes increased, our flaring1 intensity continues to decline, decreasing 4% in 2021. Routine flaring volumes were collected for the first time in 2021. Routine flaring represents only 5% of our total volume of gas flared.
C5. Emissions methodology

C5.1

Emissions in reporting year (metric tons CO2e)
<Not Applicable>

Emissions calculation methodology
<Not Applicable>

Percentage of emissions calculated using data obtained from suppliers or value chain partners
<Not Applicable>

Please explain
Based on review of industry LCA literature in 2013 and industry collaboration to determine material sources of Scope 3 emissions in 2014, ConocoPhillips believes this category is not material (not relevant) because of its size - i.e. we believe it represents less than 0.5% of its total Scope 3 emissions.

C6.7

(C6.7) Are carbon dioxide emissions from biogenic carbon relevant to your organization?
No

C6.10
(C6.10) Describe your gross global combined Scope 1 and 2 emissions for the reporting year in metric tons CO2e per unit currency total revenue and provide any additional intensity metrics that are appropriate to your business operations.

Intensity figure
0.00041

Metric numerator (Gross global combined Scope 1 and 2 emissions, metric tons CO2e)
18720000

Metric denominator
unit total revenue

Metric denominator: Unit total
45828000000

Scope 2 figure used
Location-based

% change from previous year
52

Direction of change
Decreased

Reason for change
Absolute emissions increased from 16.2 MMTCO2e in 2020 to 18.7 MMTCO2e in 2021. The denominator used for this intensity indicators uses revenue; sales and other operating revenues increased 144 percent in 2021, mainly due to higher realized commodity prices.

Intensity figure
0.027

Metric numerator (Gross global combined Scope 1 and 2 emissions, metric tons CO2e)
18720000

Metric denominator
barrel of oil equivalent (BOE)

Metric denominator: Unit total
694000000

Scope 2 figure used
Location-based

% change from previous year
21

Direction of change
Decreased

Reason for change
Total production, including Libya, of 1,567 MBOED increased 440 MBOED or 39 percent in 2021 compared with 2020 primarily due to:

- Higher volumes in Lower 48 due to our Concho acquisition.
- New wells online in Lower 48, Canada, Norway, Malaysia and Alaska.
- Absence of production curtailments, primarily in our North American assets.
- Higher production in Libya due to the absence of a forced shutdown of the Es Sider export terminal and other eastern export terminals.
- Improved well performance in Norway, Canada, Alaska and China.

(C-OG6.12) Provide the intensity figures for Scope 1 emissions (metric tons CO2e) per unit of hydrocarbon category.

Unit of hydrocarbon category (denominator)
Other, please specify (Thousand barrel of oil equivalent BOE)

Metric tons CO2e from hydrocarbon category per unit specified
25.53

% change from previous year
22

Direction of change
Decreased

Reason for change
Total production, including Libya, of 1,567 MBOED increased 440 MBOED or 39 percent in 2021 compared with 2020 primarily due to:

- Higher volumes in Lower 48 due to our Concho acquisition.
- New wells online in Lower 48, Canada, Norway, Malaysia and Alaska.
- Absence of production curtailments, primarily in our North American assets.
- Higher production in Libya due to the absence of a forced shutdown of the Es Sider export terminal and other eastern export terminals.
- Improved well performance in Norway, Canada, Alaska and China.

Comment
C-OG6.13

(C-OG6.13) Report your methane emissions as percentages of natural gas and hydrocarbon production or throughput.

Oil and gas business division
Upstream

Estimated total methane emitted expressed as % of natural gas production or throughput at given division
0.23

Estimated total methane emitted expressed as % of total hydrocarbon production or throughput at given division
0.07

Comment
For the first answer we divide tonnes of methane emitted by tonnes of natural gas production. For the second answer we divide tonnes of methane emitted divided by tonnes of hydrocarbon product. Because we are calculating emissions on a gross operated basis, we assume the breakdown of 471 MMBOE gross operated production has the same percentage split as our net production, sourced from our Annual Report. Factors used: 0.1364 tonnes/bbl crude oil and bitumen, 0.0867 tonnes/bbl NGL, 25 toe/mmscf natural gas - yielding a methane intensity of 0.28% and 0.1% for natural gas and hydrocarbon throughput, respectively.

C7. Emissions breakdowns

C7.1

(C7.1) Does your organization break down its Scope 1 emissions by greenhouse gas type?
Yes

C7.1a

(C7.1a) Break down your total gross global Scope 1 emissions by greenhouse gas type and provide the source of each used greenhouse warming potential (GWP).

**Direction of change**

Increased

**Please explain**

Total production, including Libya, of 1,567 MBOED increased 440 MBOED or 39 percent in 2021 compared with 2020 primarily due to:

- Higher volumes in Lower 48 due to our Concho acquisition.
- New wells online in Lower 48, Canada, Norway, Malaysia and Alaska.
- Absence of production curtailments, primarily in our North American assets.
- Higher production in Libya due to the absence of a forced shutdown of the Es Sider export terminal and other eastern export terminals.
- Improved well performance in Norway, Canada, Alaska and China.

**Description**

Other, please specify (Produced water recycled/reused)

**Metric value**

80

**Metric numerator**

Million Cubic Meters

**Metric denominator (intensity metric only)**

% change from previous year

25

**Direction of change**

Increased

**Please explain**

Total volume of produced water recycled or reused for operated assets increased 16.2 million cubic meters or 25 percent in 2021 compared with 2020 primarily due to:
• Higher recycling volumes in Lower 48 due to our Concho acquisition.
• Higher recycling volumes in Canada oil sands.
• Higher reuse volumes in Alaska

C-OG9.2a

(C-OG9.2a) Disclose your net liquid and gas hydrocarbon production (total of subsidiaries and equity-accounted entities).

<table>
<thead>
<tr>
<th>In-year net production</th>
<th>Comment</th>

Comment
% emissions covered by tax is Norway 2021 Scope 1 emissions / company Scope 1 emissions. Due to emission baselines or tax jurisdictions, this number may not be exact. Cost is net share before tax.

C11.1d

(C11.1d) What is your strategy for complying with the systems you are regulated by or anticipate being regulated by?

For the facilities we operate, our strategy is to invest in on-site energy efficiency projects to directly reduce GHG emissions, thereby reducing our long-term compliance costs (either by generating emission performance credits or simply a reduction in our direct obligation). We meet any remaining liability through the most efficient means available under the local Emissions Trading Scheme, whether this be through freely issued allowances, the purchase or origination of domestic or international project-based offsets or locally issued government credits. For example, in Canada Flow Control Devices (FCDs) support even steam distribution into the reservoir and help prevent steam production into the well that could damage the liner and cause it to fail. FCDs may also improve Steam Oil Ratio (SOR) by 10 percent. Using less steam helps us reduce SOR and therefore greenhouse gas intensity. Through application of this strategy, we reduced the cost of compliance with Alberta CCIR.
C11.2

(C11.2) Has your organization originated or purchased any project-based carbon credits within the reporting period?

No

C11.3

(C11.3) Does your organization use an internal price on carbon?

Yes

C11.3a

(C11.3a) Provide details of how your organization uses an internal price on carbon.

Objective for implementing an internal carbon price
- Navigate GHG regulations
- Change internal behavior
- Drive energy efficiency
- Drive low-carbon investment
- Stress test investments
- Identify and seize low-carbon opportunities

GHG Scope
- Scope 1
- Scope 2

Application
We use GHG pricing to navigate GHG regulations, change internal behavior, drive energy efficiency and low-carbon investment, and stress test investments.

Actual price(s) used (Currency /metric ton)
- 60

Variance of price(s) used
There is no variance for any jurisdictions, unless they already have a higher cost of carbon legislated.

Type of internal carbon price
- Shadow price

Impact & implication
In 2021, the company used a range of estimated future costs of GHG emissions for internal planning purposes, including an estimate of $60 per tonne CO2e applied beginning in the year 2024 as a sensitivity to evaluate certain future projects and opportunities. We have further developed the methodology by which qualifying projects will include GHG pricing in their project approval economics and long-term planning. The base case for project approval economics and planning will now include either the forecast of existing GHG pricing regulations or our current probability-weighted energy transition scenario for that jurisdiction, depending on which is higher. Where there is no GHG price regulation, we use the current transition scenario for that jurisdiction.

C12. Engagement

C12.1

(C12.1) Do you engage with your value chain on climate-related issues?

Yes, our suppliers
Yes, our customers/clients
Yes, other partners in the value chain

C12.1a
(C12.1a) Provide details of your climate-related supplier engagement strategy.

**Type of engagement**
Engagement & incentivization (changing supplier behavior)

**Details of engagement**
Run an engagement campaign to educate suppliers about climate change

**% of suppliers by number**
1

**% total procurement spend (direct and indirect)**
30

**% of supplier-related Scope 3 emissions as reported in C6.5**

**Rationale for the coverage of your engagement**
We engaged our critical suppliers as they represented a significant portion of spend and environmental footprint.

**Impact of engagement, including measures of success**
As we integrate sustainable development into our key business activities, suppliers play a significant role. From constructing our facilities to managing our work camps, providing well services and supplying equipment, how they manage their impact on the environment and community is important to us and affects our performance.

We regularly engage our suppliers through business reviews and supplier audits to:

- Identify sustainable development opportunities and risks in the supply chains of critical categories.
- Standardize Key Performance Indicators (KPIs) to ensure alignment with our Environmental, Social and Governance (ESG) performance objectives.
- Track metrics, review performance, and identify continuous improvement opportunities.
- Share best practices for building supplier capacity throughout the supply chain.

Another important element of our ongoing engagement with key suppliers is our annual Supplier Sustainability Forum. In 2021, we hosted a virtual forum with 120 participants including suppliers from more than 50 companies and ConocoPhillips representatives from across the globe. The agenda was designed to communicate our strategic sustainability objectives and collaborate with suppliers to manage and mitigate the environmental and social impacts from activities and operations throughout the supply chain. Topics discussed included our net-zero ambition and Triple Mandate, an introduction to our Low Carbon Technologies organization, and an overview of technologies deployed to help reduce environmental impacts and improve sustainability.

**Supplier Recognition**
Suppliers who positively impact our business are honored by our annual Supplier Recognition Awards. Sustainability is an integral consideration for these supplier awards. In 2021, awards ranged from gas capture solutions to environmental planning.

**Comment**

C12.1b
(C12.1b) Give details of your climate-related engagement strategy with your customers.

**Type of engagement & Details of engagement**

<table>
<thead>
<tr>
<th>Collaboration &amp; innovation</th>
<th>Other, please specify (NRG Canada's Oil Sands Innovation Alliance (COSIA) Carbon XPRIZE.)</th>
</tr>
</thead>
</table>

% of customers by number

% of customer-related Scope 3 emissions as reported in C6.5

Please explain the rationale for selecting this group of customers and scope of engagement

The NRG COSIA Carbon XPRIZE inspires development of new and emerging CO2 conversion technologies to help solve climate change. The US$20 million Carbon XPRIZE project is a Canada's Oil Sands Innovation Alliance (COSIA) joint industry project led by ConocoPhillips, along with six other COSIA members and NRG Energy.

Impact of engagement, including measures of success

Technology will play a major role in reducing greenhouse gas (GHG) emissions. Whether through reducing emissions or lowering the energy intensity of our operations, we are committed to managing climate-related risks and opportunities.

Prize competitors are developing breakthrough technologies to convert carbon dioxide (CO2) emissions from industrial processes and power generation into usable products. Breakthroughs in the conversion of CO2 could ultimately lead to new manufacturing processes and markets that can help drive down global emissions. The dual track competition, which kicked off in 2015, is funded by six companies, led by ConocoPhillips Canada under the COSIA umbrella, and NRG Energy, a leading U.S. integrated power company. The 10 finalist teams, from five different countries are competing for prizes totaling U.S. $20 million.

Finalists spent the past two years testing their technologies and evaluating efficacy and potential for commercial deployment. The two teams that convert the greatest amount of CO2 into products with the highest net value while minimizing their environmental footprint will be the grand prize winners. Team projects showcase a variety of innovative ideas, converting captured CO2 into products like enhanced concrete, liquid fuels, plastics, carbon fiber and ethanol. To learn more about some of the finalists click on the team name:

- Carbon Cure: Using CO2 to create stronger, "greener" concrete.
- Carbon Upcycling: Transforming CO2 into the base materials for a wide range of products, ranging from batteries to plastics to concrete.
- CERT: Converting CO2 into ethylene, a feedstock for numerous consumer products.
- Air Company: Using CO2 to create chemicals such as ethanol.

The competition is divided into two parallel tracks with five teams competing in each. The Wyoming Track teams demonstrated conversion emissions at the Integrated Test Center, adjacent to a coal-fired power plant in Gillette, WY. The Alberta Track teams demonstrated conversion of emissions at the Alberta Carbon Conversion Technology Centre, adjacent to a natural gas-fired power plant in Calgary, Alberta, Canada. Coal flue gases typically contain a greater number of contaminants compared to natural gas flue gases while natural gas flue gases typically contain less CO2 by volume than coal flue gases.

(C12.1d) Give details of your climate-related engagement strategy with other partners in the value chain.

The communities we work in are also part of almost every step of our value chain, and we engage them through processes in our Community Engagement Management System (http://www.conocophillips.com/sustainable-development/people-society/engaging-stakeholders/Pages/engaging-with-communities.aspx).

We prioritize and track progress through the Stakeholder Engagement Action Plan. We also engage externally through sponsorship of MIT's Joint Program on the Science and Policy of Global Change; constructively engaging in the development of climate change legislation and regulation. This relates to our value chain in everything from drilling to production to sales.

(C12.2) Do your suppliers have to meet climate-related requirements as part of your organization’s purchasing process?

Please select

(C12.3)
Does your organization engage in activities that could either directly or indirectly influence policy, law, or regulation that may impact the climate?

Row 1

Direct or indirect engagement that could influence policy, law, or regulation that may impact the climate
Yes, we engage directly with policy makers
Yes, we engage indirectly through trade associations
Yes, we engage indirectly by funding other organizations whose activities may influence policy, law, or regulation that may significantly impact the climate

Does your organization have a public commitment or position statement to conduct your engagement activities in line with the goals of the Paris Agreement?
Please select

Attach commitment or position statement(s)
<Not Applicable>

Describe the process(es) your organization has in place to ensure that your engagement activities are consistent with your overall climate change strategy
ConocoPhillips supports well-designed climate policy that is practical, equitable and cost-effective in reducing greenhouse gas (GHG) emissions. We support the aim of the Paris Agreement to limit the rise of global average temperatures well below 2 degrees Celsius which is reflected in our Paris-aligned ambition to be a net-zero operational emissions company by 2050.

Proactive Engagement
Climate-related policy action can support an orderly transition to a low-carbon economy, facilitate the development of innovative technology and reduce the overall risks associated with climate. We have been actively engaged in climate-related discussions with policy makers and stakeholders since our first global climate change position was published in 2003. Our approach to public policy engagement on climate change has evolved. However, we remain consistent in our view that market-based solutions at national and global levels, rather than a patchwork of less efficient regulatory approaches, will be most effective in reducing GHG emissions.

Among our efforts, ConocoPhillips is a founding member of the Climate Leadership Council (CLC), an international policy institute founded in collaboration with business and environmental interests to promote a carbon dividends framework in the U.S. as the most cost-effective, equitable and politically viable climate solution. Participation in the CLC provides an opportunity for ongoing dialogue about carbon pricing and framing the issues in alignment with our principles. We are also a member of Americans for Carbon Dividends (AFCD), the education and advocacy branch of the CLC, which focuses on progressing the bipartisan Baker-Shultz Carbon Dividends Plan. Our executive leadership team consistently engages with members of Congress and the Administration to express support for that plan. In 2021, ConocoPhillips was accepted as a Private Sector Partner within the Carbon Pricing Leadership Coalition (CPLC), a global voluntary partnership run by the World Bank to share and expand the evidence base for effective carbon pricing policies. Participation in the CPLC further demonstrates our commitment to carbon pricing and is complementary to our engagement with the CLC.

Primary reason for not engaging in activities that could directly or indirectly influence policy, law, or regulation that may impact the climate
<Not Applicable>

Explain why your organization does not engage in activities that could directly or indirectly influence policy, law, or regulation that may impact the climate
<Not Applicable>

C12.3a

(C12.3a) On what policy, law, or regulation that may impact the climate has your organization been engaging directly with policy makers in the reporting year?

C12.3b

(C12.3b) Provide details of the trade associations your organization engages with which are likely to take a position on any policy, law or regulation that may impact the climate.

Trade association
American Petroleum Institute

Is your organization’s position on climate change consistent with theirs?
Consistent

Has your organization influenced, or is your organization attempting to influence their position?
We publicly promote their current position

State the trade association’s position on climate change, explain where your organization’s position differs, and how you are attempting to influence their position (if applicable)

API's Climate Framework: We share with global leaders the goal of reduced emissions across the broader economy and, specifically, those from energy production, transportation and use by society. To achieve meaningful emissions reductions that meet the climate challenge, it will take a combination of policies, innovation, industry initiatives and a partnership of government and economic sectors. The objective is large enough that no single approach can achieve it.

Industry Action Plan:
1. Accelerate Technology and Innovation to reduce emissions while meeting growing energy needs
2. Further Mitigate Emissions from Operations to advance additional environmental progress
3. Endorse a Carbon Price Policy by government to drive economywide, market-based solutions
4. Advance Cleaner Fuels to provide lower-carbon choices for consumers

Potential Approach Would Price Carbon Dioxide Emissions Across the Economy
Support Policies that Provide Transparency for Consumers
Minimize Duplicative Regulations and Help Maintain U.S. Competitiveness
Avoid Carbon Leakage and Integrate with Global Carbon Markets, while Focusing on Net Emissions
Develop Markets for Differentiated U.S. Natural Gas
Support Policies to Advance Lower-Carbon Electricity
ConocoPhillips: Our consistent, strong engagement with our major trade associations has influenced their climate policy positions to include support for a market-based approach to GHG emissions. Many trade organizations we participate in have climate change positions aligned to ours. Where they do not, we have continued to offer our viewpoint and attempt to work with them to better align their position with ours. In addition to actively participating in trade organization position updates, we have also voted against or abstained from supporting specific actions requested by a trade organization if their positions were not aligned with ours.

Funding figure your organization provided to this trade association in the reporting year, if applicable (currency as selected in C0.4) (optional)

Describe the aim of your organization’s funding

Have you evaluated whether your organization’s engagement with this trade association is aligned with the goals of the Paris Agreement?

Yes, we have evaluated, and it is aligned

Trade association
International Association of Oil and Gas Producers (IOGP)

Is your organization’s position on climate change consistent with theirs?
Consistent

Has your organization influenced, or is your organization attempting to influence their position?
We publicly promote their current position

State the trade association’s position on climate change, explain where your organization’s position differs, and how you are attempting to influence their position (if applicable)
The International Association of Oil & Gas Producers (IOGP) welcomes the Paris Agreement and supports the international community’s commitment to address the global challenge of climate change.

We believe that the oil & gas industry is part of the solution to this challenge, which should be addressed while meeting society’s future energy needs. The long-term objective of any climate change policy should be to reduce the risk of serious impacts on society and ecosystems, while recognising the importance of availability, reliability and affordability of energy to society, which is essential to human prosperity and well-being.

ConocoPhillips: Our consistent, strong engagement with our major trade associations has influenced their climate policy positions to include support for a market-based approach to GHG emissions.

Many trade organizations we participate in have climate change positions aligned to ours. Where they do not, we have continued to offer our viewpoint and attempt to work with them to better align their position with ours. In addition to actively participating in trade organization position updates, we have also voted against or abstained from supporting specific actions requested by a trade organization if their positions were not aligned with ours.

Funding figure your organization provided to this trade association in the reporting year, if applicable (currency as selected in C0.4) (optional)

Describe the aim of your organization’s funding

Have you evaluated whether your organization’s engagement with this trade association is aligned with the goals of the Paris Agreement?

Yes, we have evaluated, and it is aligned

Trade association
Other, please specify (National Gas Supply Association (NGSA))

Is your organization’s position on climate change consistent with theirs?
Mixed

Has your organization influenced, or is your organization attempting to influence their position?
We have already influenced them to change their position

State the trade association’s position on climate change, explain where your organization’s position differs, and how you are attempting to influence their position (if applicable)
NGSA recognizes that the burning of fossil fuels leads to increased concentrations of greenhouse gases in the atmosphere, which contribute to climate change.

NGSA supports the ambition of achieving economy-wide net zero GHG emissions by 2050, consistent with our support for the goals of the Paris Agreement. NGSA advocates for rules and policies that protect the environment while allowing our members to continue to supply electric utilities, manufacturers, businesses and households with affordable and reliable natural gas.

Energy policies must allow consumers to reap the benefits of our natural gas resources, ensuring that no consumers are left behind as we transition to a clean and affordable energy future.

Natural gas has played a significant role in reducing CO2 emissions from the U.S. power sector to 25-year lows because of its relatively low carbon content and because of its role as an integral partner to renewables. NGSA members believe that adopting a price on carbon can further drive down carbon emissions, while protecting consumers and maintaining competition and innovation in power markets.

ConocoPhillips: Our consistent, strong engagement with our major trade associations has influenced their climate policy positions to include support for a market-based approach to GHG emissions.

Many trade organizations we participate in have climate change positions aligned to ours. Where they do not, we have continued to offer our viewpoint and attempt to work with them to better align their position with ours. In addition to actively participating in trade organization position updates, we have also voted against or abstained from supporting specific actions requested by a trade organization if their positions were not aligned with ours.

Funding figure your organization provided to this trade association in the reporting year, if applicable (currency as selected in C0.4) (optional)

Many trade organizations we participate in have climate change positions aligned to ours. Where they do not, we have continued to offer our viewpoint and attempt to work with them to better align their position with ours. In addition to actively participating in trade organization position updates, we have also voted against or abstained from supporting specific actions requested by a trade organization if their positions were not aligned with ours.

Funding figure your organization provided to this trade association in the reporting year, if applicable (currency as selected in C0.4) (optional)

Describe the aim of your organization’s funding

<Not Applicable>

Have you evaluated whether your organization’s engagement with this trade association is aligned with the goals of the Paris Agreement?

Yes, we have evaluated, and it is aligned

Trade association
National Association of Manufacturers

Is your organization’s position on climate change consistent with theirs?
Mixed

Has your organization influenced, or is your organization attempting to influence their position?

We are attempting to influence them to change their position

State the trade association’s position on climate change, explain where your organization’s position differs, and how you are attempting to influence their position (if applicable)

Climate change is happening. Human activities are contributing. The NAM supports the objectives of the Paris Climate Agreement to significantly reduce the risks and impacts of global climate change. Manufacturers are committed to helping address climate change while increasing the global competitiveness of U.S. industries. U.S. manufacturers are leading and the results have been unprecedented: we are significantly more carbon efficient than most of our global competitors, and the U.S. has reduced its total GHG emissions more than any other nation. We are committed to being part of the solution and encourage all other sectors of the American economy to join us. Manufacturers are advocating for policies that encourage domestic emissions reductions so that the U.S. continues to lead on the global stage, driving our international counterparts to do the same. All sectors of the global economy will have to do their part to limit global GHG emissions. U.S. manufacturers are both creators and users of the technologies that will be vital to reducing global emissions. Accordingly, sound policy for U.S. manufacturers is one that reduces emissions while maintaining their global competitiveness.

ConocoPhillips: Our consistent, strong engagement with our major trade associations has influenced their climate policy positions to include support for a market-based approach to GHG emissions.

Many trade organizations we participate in have climate change positions aligned to ours. Where they do not, we have continued to offer our viewpoint and attempt to work with them to better align their position with ours. In addition to actively participating in trade organization position updates, we have also voted against or abstained from supporting specific actions requested by a trade organization if their positions were not aligned with ours.

Funding figure your organization provided to this trade association in the reporting year, if applicable (currency as selected in C0.4) (optional)

Describe the aim of your organization’s funding

<Not Applicable>

Have you evaluated whether your organization’s engagement with this trade association is aligned with the goals of the Paris Agreement?

Yes, we have evaluated, and it is aligned

Trade association
US Chamber of Commerce

Is your organization’s position on climate change consistent with theirs?
Mixed

Has your organization influenced, or is your organization attempting to influence their position?

We are attempting to influence them to change their position

State the trade association’s position on climate change, explain where your organization’s position differs, and how you are attempting to influence their position (if applicable)

For more than a decade, the U.S. Chamber of Commerce has asserted that the climate is changing, humans are contributing to these changes, and inaction is not an option. The Chamber’s members are already developing, financing, building, and operating the innovative solutions needed to effectively reduce emissions, combat climate change, and meet rising energy demands. We support market-based solutions to reduce emissions and support U.S. competitiveness, national security, and American workers. Mobilized business community support for the 2020 passage of the Energy Act, ensuring it contained innovation-focused measures that addressed climate change, promoted American technological leadership, and fostered continued economic growth. Played a leading role in the passing of bipartisan legislation to implement a phase down of hydrofluorocarbons, which will have a major direct impact on reducing greenhouse gas emissions. Called for direct regulations on methane emissions from oil and gas operations, worked with Congress to help improve pre-disaster mitigation and resilience policies, and supported legislation that would mobilize private capital to promote carbon capture, utilization, and sequestration technologies. Supports bipartisan infrastructure legislation that would provide $100 billion to advance efforts to decarbonize the economy, leading a coalition of more than 300 business, environmental, and labor organizations in support of the bill.

ConocoPhillips: Our consistent, strong engagement with our major trade associations has influenced their climate policy positions to include support for a market-based approach to GHG emissions.

Many trade organizations we participate in have climate change positions aligned to ours. Where they do not, we have continued to offer our viewpoint and attempt to work with them to better align their position with ours. In addition to actively participating in trade organization position updates, we have also voted against or abstained from supporting specific actions requested by a trade organization if their positions were not aligned with ours.

As a member of the Climate Solutions Working Group, ConocoPhillips leadership and influence led to the organization’s adoption of a more clearly defined climate change policy.

Funding figure your organization provided to this trade association in the reporting year, if applicable (currency as selected in C0.4) (optional)

Describe the aim of your organization’s funding

<Not Applicable>

Have you evaluated whether your organization’s engagement with this trade association is aligned with the goals of the Paris Agreement?
Trade association
Other, please specify (Business Round Table)

Is your organization’s position on climate change consistent with theirs?
Mixed

Has your organization influenced, or is your organization attempting to influence their position?
We publicly promote their current position

State the trade association’s position on climate change, explain where your organization’s position differs, and how you are attempting to influence their position (if applicable)
Addressing climate change and its impacts demands a robust, coordinated effort with a sound policy portfolio. Business Roundtable CEOs are calling for a well-designed market-based mechanism and other supporting policies to provide certainty and unleash innovation to lift America toward a cleaner, brighter future.

Unchecked, climate poses significant environmental, economic, public health and security threats to countries around the world, including the United States. While the United States has made significant progress toward reducing greenhouse gas (GHG) emissions as a result of private sector innovation and supportive state and federal policies, the existing patchwork of federal and state regulations, tax incentives, subsidies and other policies is inefficient and has negatively impacted the long-term investment strategies of many U.S. companies by creating regulatory uncertainty. It is time for a new approach.

Business Roundtable believes corporations should lead by example, support sound public policies and drive the innovation needed to address climate change. To this end, the United States should adopt a more comprehensive, coordinated and market-based approach to reduce emissions. This approach must be pursued in a manner that ensures environmental effectiveness while fostering innovation, maintaining U.S. competitiveness, maximizing compliance flexibility and minimizing costs to business and society. International cooperation and diplomacy backed by a broadly supported U.S. policy will be the key to achieving the collective global action required to meet the scope of the challenge and position the U.S. economy for long-term success.

ConocoPhillips: Our consistent, strong engagement with our major trade associations has influenced their climate policy positions to include support for a market-based approach to GHG emissions.

Many trade organizations we participate in have climate change positions aligned to ours. Where they do not, we have continued to offer our viewpoint and attempt to work with them to better align their position with ours. In addition to actively participating in trade organization position updates, we have also voted against or abstained from supporting specific actions requested by a trade organization if their positions were not aligned with ours.

We are fully aligned on most elements of their climate position and continue to drive the BRT to take a position on the direct regulation of methane.

Funding figure your organization provided to this trade association in the reporting year, if applicable (currency as selected in C0.4) (optional)

Describe the aim of your organization’s funding

Have you evaluated whether your organization’s engagement with this trade association is aligned with the goals of the Paris Agreement?
Yes, we have evaluated, and it is aligned

Trade association
Other, please specify (American Exploration and Production Council (AXPC))

Is your organization’s position on climate change consistent with theirs?
Mixed

Has your organization influenced, or is your organization attempting to influence their position?
We are attempting to influence them to change their position

State the trade association’s position on climate change, explain where your organization’s position differs, and how you are attempting to influence their position (if applicable)

American oil and gas producers have an irreplaceable role in meeting the challenge of global climate change. AXPC, representing large independent American oil and gas producers, supports innovative, collaborative solutions that lower greenhouse gas (GHG) emissions while meeting the world’s growing need for abundant, low cost, reliable energy. Successful public policy must recognize that oil and gas underpins our standard of living and American oil and gas is critical to our national security and economic prosperity.

The following principles will guide AXPC’s climate advocacy efforts, including policy that:
- Facilitates meaningful GHG emissions reductions
- Requires proportional participation from all sectors of the economy
- Utilizes fair, consistent and transparent measurement methodologies across industries
- Encourages and appropriately accounts for early and/or voluntary actions
- Minimizes inconsistent, redundant and/or contradictory regulations and policies
- Attributes to energy producers only emissions arising during production operations
- Balances economic, environmental and energy security needs
- Ensures the development of critical energy infrastructure
- Makes the costs and associated climate benefits of any policy fully transparent to the American public
- Ensures that the United States shoulders an equitable burden under international agreements
- Does not disadvantage American oil and gas producers and workers against foreign competitors
- Promotes innovation
- Champions economy-wide public and private investment to develop cost-effective technologies that will materially reduce GHG emissions
- Relies upon predictable and economically efficient policy frameworks, such as the use of market-based policies and/or offsets, to deliver outcomes at the lowest cost to society
- Allows all energy sources to compete for innovation funding

ConocoPhillips: Our consistent, strong engagement with our major trade associations has influenced their climate policy positions to include support for a market-based approach to GHG emissions.

Many trade organizations we participate in have climate change positions aligned to ours. Where they do not, we have continued to offer our viewpoint and attempt to work with them to better align their position with ours. In addition to actively participating in trade organization position updates, we have also voted against or abstained from supporting specific actions requested by a trade organization if their positions were not aligned with ours.
C12.3c

(C12.3c) Provide details of the funding you provided to other organizations in the reporting year whose activities could influence policy, law, or regulation that may impact the climate.

**Type of organization**
Non-Governmental Organization (NGO) or charitable organization

**State the organization to which you provided funding**
Climate Leadership Council (CLC)

**Funding figure your organization provided to this organization in the reporting year (currency as selected in C0.4)**

ConocoPhillips is a founding member of the Climate Leadership Council (CLC), an international policy institute founded in collaboration with business and environmental interests to promote a carbon dividends framework in the U.S. as the most cost-effective, equitable and politically viable climate solution. Participation in the CLC provides an opportunity for ongoing dialogue about carbon pricing and framing the issues in alignment with our principles. We are also a member of Americans for Carbon Dividends (AFCD), the education and advocacy branch of the CLC, which focuses on progressing the bipartisan Baker-Shultz Carbon Dividends Plan. Our executive leadership team consistently engages with members of Congress and the Administration to express support for that plan.

**Have you evaluated whether this funding is aligned with the goals of the Paris Agreement?**
Yes, we have evaluated, and it is aligned

**State the organization to which you provided funding**
Carbon Pricing Leadership Coalition (CPLC)

**Funding figure your organization provided to this organization in the reporting year (currency as selected in C0.4)**

In 2021, ConocoPhillips was accepted as a Private Sector Partner within the Carbon Pricing Leadership Coalition (CPLC), a global voluntary partnership run by the World Bank to share and expand the evidence base for effective carbon pricing policies. Participation in the CPLC further demonstrates our commitment to carbon pricing and is complementary to our engagement with the CLC.

**Have you evaluated whether this funding is aligned with the goals of the Paris Agreement?**
Yes, we have evaluated, and it is aligned

C15. Biodiversity

---

C15.1
### C15.1 Is there board-level oversight and/or executive management-level responsibility for biodiversity-related issues within your organization?

<table>
<thead>
<tr>
<th>Board-level oversight and/or executive management-level responsibility</th>
<th>Description of oversight and objectives relating to biodiversity</th>
<th>Scope of board-level oversight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes, both board-level oversight and executive management-level responsibility</td>
<td>ConocoPhillips uses a strategic planning process and risk management tools, to integrate evolving trends, including those related to biodiversity, into the company’s framework for decision making. Environmental, water, biodiversity and social performance are key components of our long-range planning process, and we have a comprehensive governance framework for sustainable development (SD) risks and opportunities that extends from the Board of Directors’ Public Policy and Sustainability Committee, through the Executive Leadership Team (ELT), to leaders and internal subject matter experts. The Public Policy and Sustainability Committee (PPSC) is responsible for identifying, evaluating and monitoring sustainable development and climate-related trends and risks that could affect business activities and performance. The PPSC makes recommendations to the Board and monitors compliance with the company’s policies, programs and practices regarding: Health, safety, security (excluding cybersecurity); Environmental protection; Climate change; Water; Biodiversity; Human rights and social issues; Among other. The PPSC oversees enterprise risk management (ERM) and cybersecurity. The AFC facilitates appropriate coordination among the Board committees to ensure that our risk management processes are in place with necessary steps taken to foster a culture of prudent decision making throughout the company. The AFC receives annual updates on how enterprise risk is being addressed, mitigated and managed across the company, including sustainable development considerations that influence market, reputational, operational and political risks within the ERM system. The Executive Leadership Team (ELT) has final responsibility for developing corporate strategy, implementing sustainability efforts, and reporting company performance. The key executive officer has overall accountability for corporate planning and development, including corporate strategy and long-range planning. In addition, the Sustainability and Public Policy Executive Council (SPEC), a sub-committee of the ELT, has global oversight of existing and emerging sustainable development (SD) and public policy risks and trends including SD issues related to Climate, Water, Biodiversity and Social, strategic planning, risk management and public reporting.</td>
