---

## About this Standard.

---

### Purpose

The purpose of this standard is to provide defenses to safely conduct work in Hydrogen Sulphide (H<sub>2</sub>S) Environments.

---

# 1. Hydrogen Sulphide (H<sub>2</sub>S) Properties

## Sources of H<sub>2</sub>S

Examples of potential H<sub>2</sub>S sources or locations where H<sub>2</sub>S is found include:

- Leaks from sour gas wellheads, pipelines, piping, equipment.
- Breaking equipment integrity or Pigging activities
- Uncoupling vent and load lines and vents/ hatches on storage tanks.
- Maintenance activities
- Flaring sour or acid gas
- Trucking activities
- Gauging tanks, changing filters, and sampling.

## Physical Properties of H<sub>2</sub>S

Hydrocarbons containing H<sub>2</sub>S are commonly called “sour”. The following physical properties of H<sub>2</sub>S gas include:

- colorless and flammable
- heavier than air
- lighter than air if mixed with light hydrocarbons (i.e. methane)
- can occur as a vapour or dissolved in produced water, crude oil or condensate
- can collect in confined spaces or in headspaces of tanks, pipes, and vessels containing sour fluids.

## Health Effects of H<sub>2</sub>S

Health effects associated with H<sub>2</sub>S exposure is as follows:

H <sub>2</sub> S Concentration	Health Effects
<1 ppm	Rotten egg smell
10 ppm	No know adverse health effects
20 ppm – 50 ppm	Eye, nose, throat and lung irritation
100 ppm – 150 ppm	Sever eye, nose, throat and lung irritation, loss of smell. IDLH = 100 ppm
200 ppm – 300 ppm	Headaches, drowsiness and fluid in lungs
300 ppm – 500 ppm	Unconsciousness and death in 1 to 4 hours
500 ppm – 700 ppm	Knockdown may be fatal within 1 hour
>700 ppm	Immediate knockdown may be fatal.

## 2. Working in H<sub>2</sub>S Environments.

### 2.1. Respiratory Protective Equipment (RPE).

#### Respiratory Protective Equipment Requirements

Respiratory protection is required to mitigate H<sub>2</sub>S breathing hazards when:

- Actual or potential H<sub>2</sub>S concentrations exceed 10 ppm.
- H<sub>2</sub>S concentrations are unknown.

**NOTE:** A continuous aspirated gas detector or detector tubes are required when confirming H<sub>2</sub>S concentrations.

#### Respiratory protection type

The type of Respiratory protection equipment must be either:

Equipment	Details
SCBA	A full-face, positive pressure SCBA.
SABA	A full-face, positive pressure SABA with a 5-minute escape air bottle.

#### Fit Testing Requirements

Fit testing requirements must be followed when approved to wear respiratory protective equipment as follows:

- Workers must be fit tested for the specific respiratory protective equipment being used
- Personnel who may be required to wear RPE must be clean shaven

#### Minimum SCBA units available

The minimum number of SCBA units available on site for drilling, completions and well servicing work sites are:

Province	SCBA Units Required
Alberta	2
British Columbia	4

**NOTE:** Provincial regulations require SCBA units when a supplied air trailer is not present. Breathing air requirements at all other locations is based on hazard assessment.

## 2.2. Communication and Back-up Requirements.

### Communication and Back-up Requirements

When working in H<sub>2</sub>S environments communication and back-up requirements are as follows:

H <sub>2</sub> S Concentration	Communication and Back-up Requirements
10 ppm to 100 ppm	<ul style="list-style-type: none"> <li>Review tasks and Establish communication plan with coworker</li> <li>Establish follow-up communication intervals and Emergency Response Plan</li> <li>Implement additional Defenses per Hazard Assessment.</li> </ul>
>100 ppm	<ul style="list-style-type: none"> <li>Backup personnel must be present</li> <li>Implement additional Defenses per Hazard Assessment.</li> </ul>

### Backup Personnel

If using backup personnel, the personnel must:

- Be onsite and equipped with RPE
- Ready to immediately respond
- Be trained in H<sub>2</sub>S environments and fit tested

**NOTE:** Backup personnel must also be used when required by hazard assessment, work permits, and/or local site operating requirements.

## 2.3. Signage and Wind Indicators

### Signage and wind indicator requirements

Sites where H<sub>2</sub>S is present or known to be above 10ppm require:

- Signage at entrance warning of the presence of poisonous gas.
- Wind Indicator

**NOTE:** More than one wind indicator may be required depending on size of location and visibility to personnel.

---

### 3. Iron Sulphide.

---

#### Iron Sulphide Properties

Iron sulfide is present in most facilities where H<sub>2</sub>S and iron come in contact with each other and has the following properties:

- Nontoxic.
- Spontaneous combustion will occur in the presence of air unless kept wet.
- Can be present in vessels, tanks, piping and fittings as a brown/black deposit.

---

#### Iron Sulphide Defense Actions

Consider the following defense actions when working with Iron Sulphide:

- Maintain wet.
- Use proper containers for disposal.
- Vessels or systems may require purging with inert gas prior to admitting air.
- Piping and fittings that have had Iron Sulphide removed must be flushed with water and dried immediately.

**WARNING:** Iron Sulphide will ignite in the presence of air.
